1.The restriction requirement sent out December 21, 2007 has been vacated and an action hereby follows on claims 1, 7 and 9.

2.The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 7 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over the admitted prior art generally for reasons of record noting the following.

Applicant has amended the independent claims to recite the range for the numerical value of the width/diameter of the opening over which the electroplating is done. However, as already noted, it is submitted that the exact diameter of the opening would have been largely dependent on the size of microlens desired. There doesn't appear to be any unexpected benefit for the instant opening size and one of ordinary skill in this art would have readily determined an appropriate size with minimal experimentation—ie, routine experimentation to arrive at the desired microlens size and shape.

3.Applicant's arguments filed September 11, 2007 have been fully considered but they are not persuasive. While it may be true that the electroplating proceeds differently dependent on radius of curvature of the lens made, it is rather apparent that one of ordinary skill would have been able to conduct routine experimentation to successfully form a microlens with the desired radius of curvature. Given the state of the admitted prior art, it simply would not be an invention to determine suitable

diameters over which the prior art process would be most effective, as it appears applicant is arguing. Again, this would constitute routine experimentation or optimization and not rise to the level of invention.
